

USER INTERFACE DESIGN

EXPERIMENT-5

Aim

The aim of this experiment is to analyze the tasks performed by users in an Event Management System and represent the workflow using a user flow diagram.

Objectives

- To understand how users interact with an event management system.
- To identify the sequence of steps involved in creating and publishing events.
- To visualize the workflow of the event management process using a user flow diagram.
- To improve understanding of user navigation within an application.

Task Analysis and User Flow for Event Management System

Task Analysis

Task Analysis is the process of breaking down the user's interaction with a system into smaller steps to understand how users accomplish their goals. It helps in identifying the sequence of tasks performed by users and improves the usability of the system.

In an **Event Management System**, task analysis helps understand how users log in, create events, submit event details, get approval from administrators, publish the event, and allow participants to register.

Key Aspects of Task Analysis:

- Understanding how users interact with the event management system.
- Identifying the sequence of actions involved in creating and managing events.
- Analyzing potential issues in the event creation and approval process.
- Improving system usability and workflow for both users and administrators.

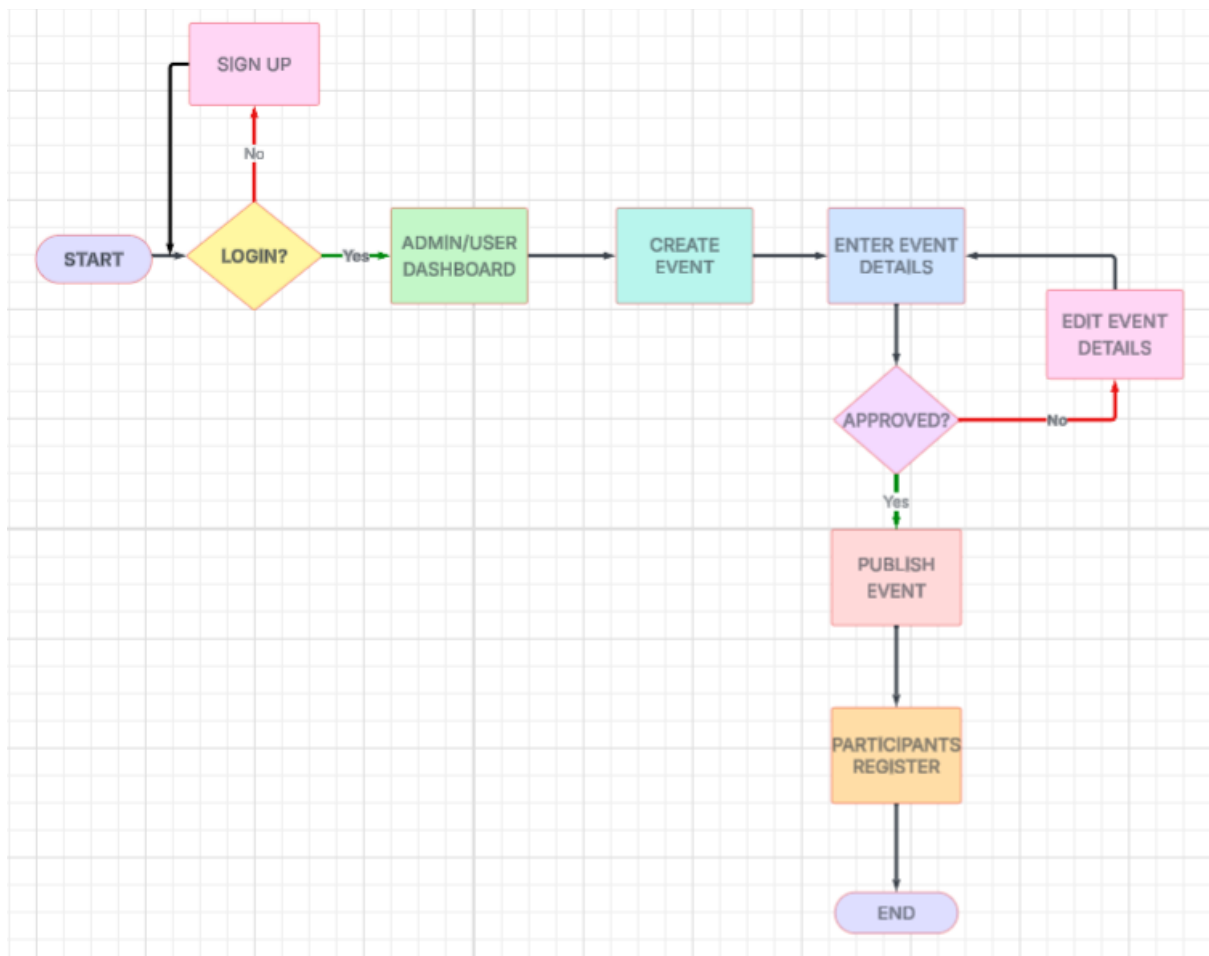

User Flow

User Flow represents the sequence of steps a user follows in an application to accomplish a specific task. It visually shows how users navigate through the system from start to completion.

In an **Event Management System**, the user flow describes how a user logs in, creates an event, submits event details for approval, and how participants register after the event is published.

User Flow for Event Management System

Start → Login / Sign Up → Admin/User Dashboard → Create Event → Enter Event Details → Approval Check → Publish Event → Participants Register → End

Step-by-Step Explanation of the Flow

Step 1: Start

- The process begins when the user opens the event management system.
- The system presents options to log in or sign up.

Step 2: Login or Sign Up

- If the user already has an account, they log in to the system.
- If the user does not have an account, they must sign up before continuing.

Step 3: Admin/User Dashboard

- After successful login, the user is redirected to the dashboard.
- The dashboard allows users to manage events and access system features.

Step 4: Create Event

- The user selects the option to create a new event.
- This step allows the user to start organizing an event within the system.

Step 5: Enter Event Details

- The user enters the event information such as event name, date, location, and description.
- These details are submitted for review.

Step 6: Approval Process

- The system checks whether the event is approved by the administrator.
- If the event is not approved, the user must edit the event details and resubmit them.

Step 7: Publish Event

- Once the event is approved, it is published on the platform.
- The event becomes visible to participants.

Step 8: Participants Register

- Participants can view the published event and register for it.
- Their registration details are stored in the system.

Step 9: End

- The process ends after participants successfully register for the event.
- The event management workflow is completed.

EVENT NAME

Annual Tech Conference 2024

DATE & TIME

October 15, 2024 • 09:00 AM

LOCATION

Grand Plaza Convention Center, Hall B

DESCRIPTION

The flagship event for software engineers and product managers. This year's focus is on AI integration and sustainable architecture. Includes lunch and networking mixers.

Result

Thus, the task analysis and user flow diagram for the **Event Management System** were successfully designed and analyzed. The diagram clearly represents the sequence of actions involved in logging in, creating events, approving events, publishing them, and allowing participants to register.
